

At the beginning, there is a search field where the user enters a [city, state] or [city, country].

Below the search field are three checkboxes (criteria) which are all enabled by default:

- Hotels
- Restaurants
- Attractions

After searching, the Expedia API would pull specified data for all enabled criteria, and then feed that data into a panel or card.

If the user turns off "Hotels" then there would be two cards, but the parent element (main) would center the cards, so there won't ever be an awkward space.

At the bottom would be a card for weather that would pull data for the specified location from the Open Weather API.

The search field would remain at the top so the user can search again.
